

Animals

Read the passage below and answer the questions on the next page.

Animals are a diverse and fascinating part of our world. They come in all shapes, sizes, and colors, have unique behaviors, and live in a variety of environments. One interesting fact about animals is that they often fill an important role in the food chain. As primary, secondary, or tertiary consumers, animals find food from other sources, such as plants or other animals.

Humans have been studying animal behavior for centuries. We use this knowledge to understand their habits and habitats better as well as to help protect them when necessary. While many species of animals face extinction due to human activities like hunting, habitat destruction or pollution, there are efforts being made to protect these species and even restore their populations.

Some animals have amazing adaptations that help them survive in their environment. For example, the arctic fox has a thick coat of fur to keep it warm in cold climates, while the koala has highly developed fingerprints used for climbing trees. Other animals, like the chameleon, have color-changing abilities to blend into their surroundings and hide from predators.

Animals also play an important role in our world by providing vital resources such as food, medicine, clothing, tools, and fertilizers. They can also help us maintain healthy ecosystems by controlling pests or spreading pollens and seeds needed for vegetation growth.

Animals are an essential part of our world. While some species may be in danger or even extinct due to human activities, there is still much that can be done to help them survive and thrive. By understanding the important roles they play in their environment and by respecting their habitats, we can ensure that these amazing creatures remain with us for years to come.

1) What adaptation does the arctic fox have to stay warm in cold climates?

2) What resources do animals provide for humans?

3) What abilities does a chameleon have?

4) What human activities have led to some animals facing extinction?

5) How do animals help us to maintain a healthy ecosystem?
